**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## Case of the Lez karst system (MEDCYSS Observatory)

## A mediterranean territory

### Main focuses

Climate change and anthropogenic impacts on water resources (quantity and quality); Recharge processes, Surface water and groundwater interactions; Extreme climatic events

### Databases:

Observatory created in 2008. First measurements date back to 1950

## Main scientific issues

Observation and modeling of transfer processes associated with various entities (surface and underground) of Mediterranean karst hydrosystems. Specific focus are:

- underground hydrodynamics of karst aquifers subject to the actions of climate and anthropogenic forcings
- rapid hydrologic processes that take place during extreme floods in Mediterranean drainage basins that have a high karst component
- development of specific methods and tools based on a coupled hydrodynamic/hydrochemical approach to determine the quantitative and qualitative risks on water resources.

## Research networks

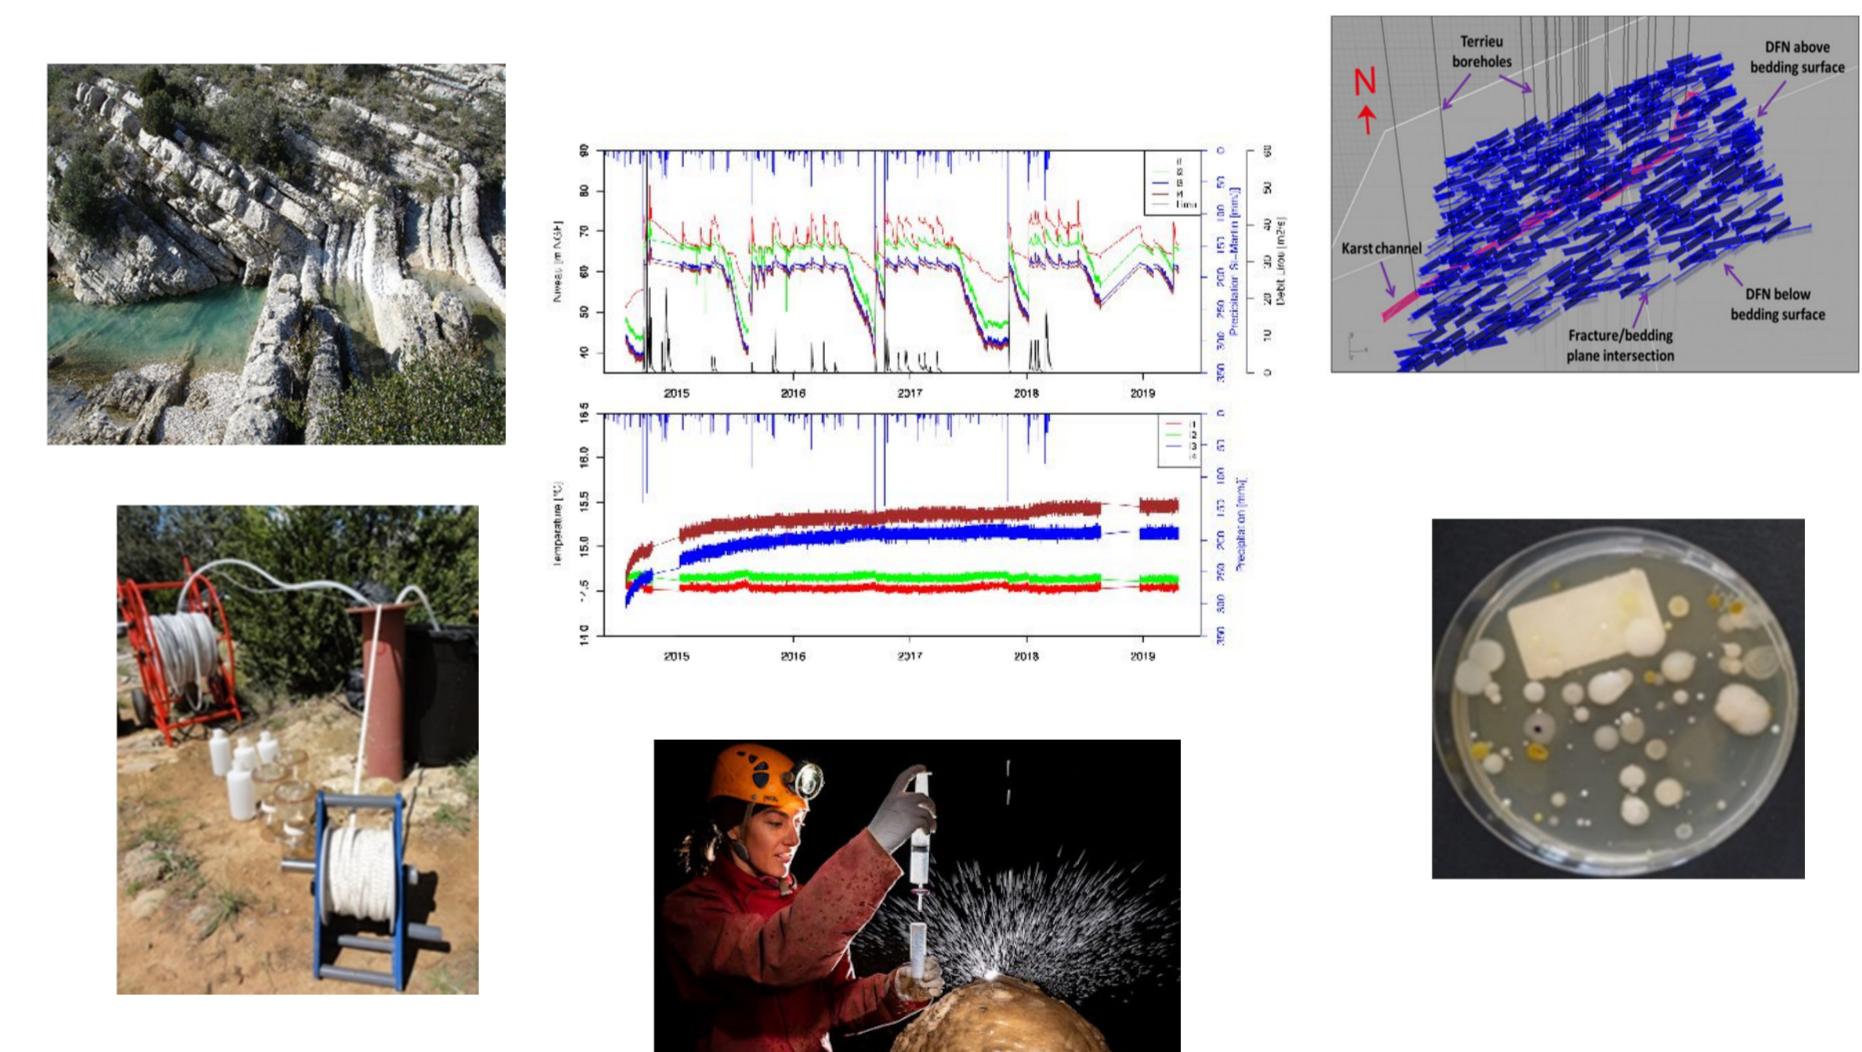

MEDCYSS belongs to national and international observation sites networks dedicated to the observation and monitoring of the Critical Zone:

- OSU OREME
- French KARST observatory network (SNO KARST, INSU/CNRS)
- Research Infrastructure OZCAR (Critical Zone Observatories: Research and Application), the French network of eLTER (European Long-Term Ecosystem Research infrastructure)

## Tools, methods and monitorings

### Regular, flood events and high frequency monitorings

- Meteorology:** 6 rain gauges, 2 weather stations (precipitation, wind, solar radiation, humidity) and a tower fluxes (water and carbon fluxes)
- Hydrology:** stream water levels and discharges (9 stations)
- Hydrodynamics:** Pressure, spring discharge (continuous monitoring). Boreholes measurements: loggings, flow profiles, pumping tests, hydraulic packers testings
- Biogeochemistry:** T°, Electrical conductivity (EC), Major and trace elements, Total Organic Carbon (TOC), Natural fluorescence, Carbon and water stable isotopes, Sr-B-Li-Ra isotopes, dissolved gases (noble and anthropogenic), microbial ecology and antimicrobial resistance.

### Data access

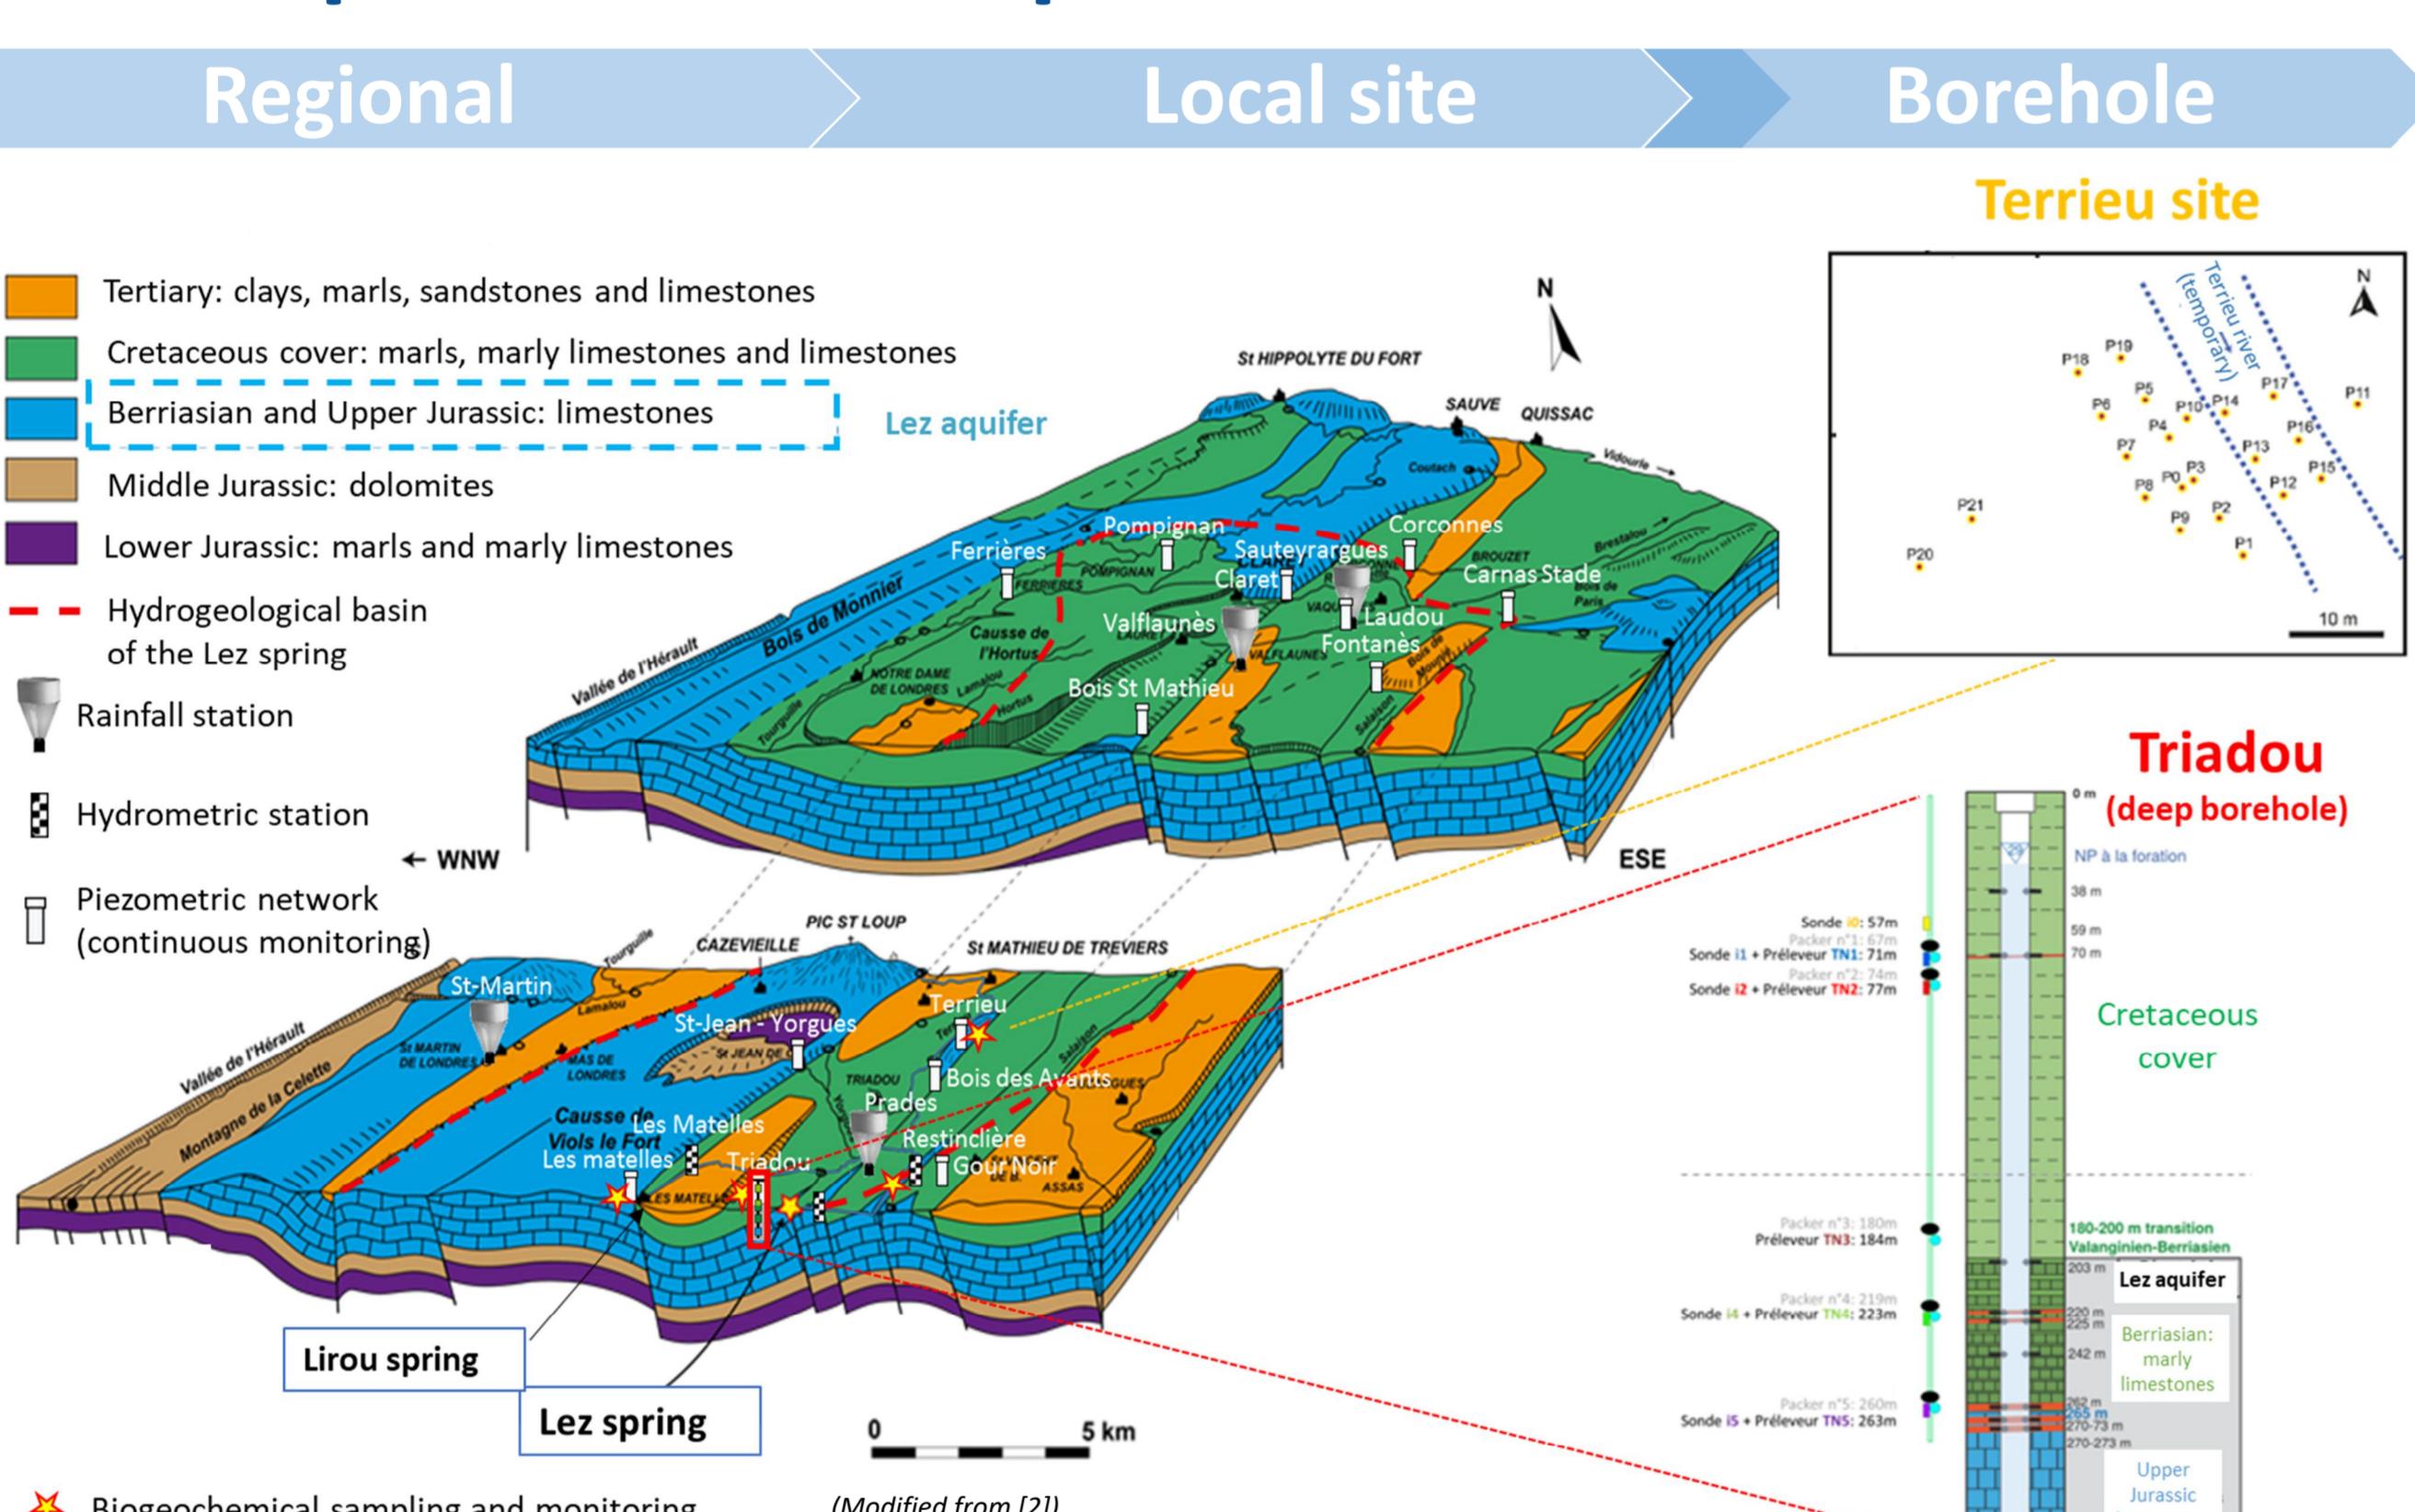

Observations are available to scientific community and general public via the following database platforms:

OSU OREME, OZCAR-THEIA, DEIMS-SDR eLTER

<https://data.oreme.org/observation/snokarst>

<https://deims.org/5b5ca767-0993-429c-8e58-a7efa39c936a>

## Multiscale spatial and temporal observations

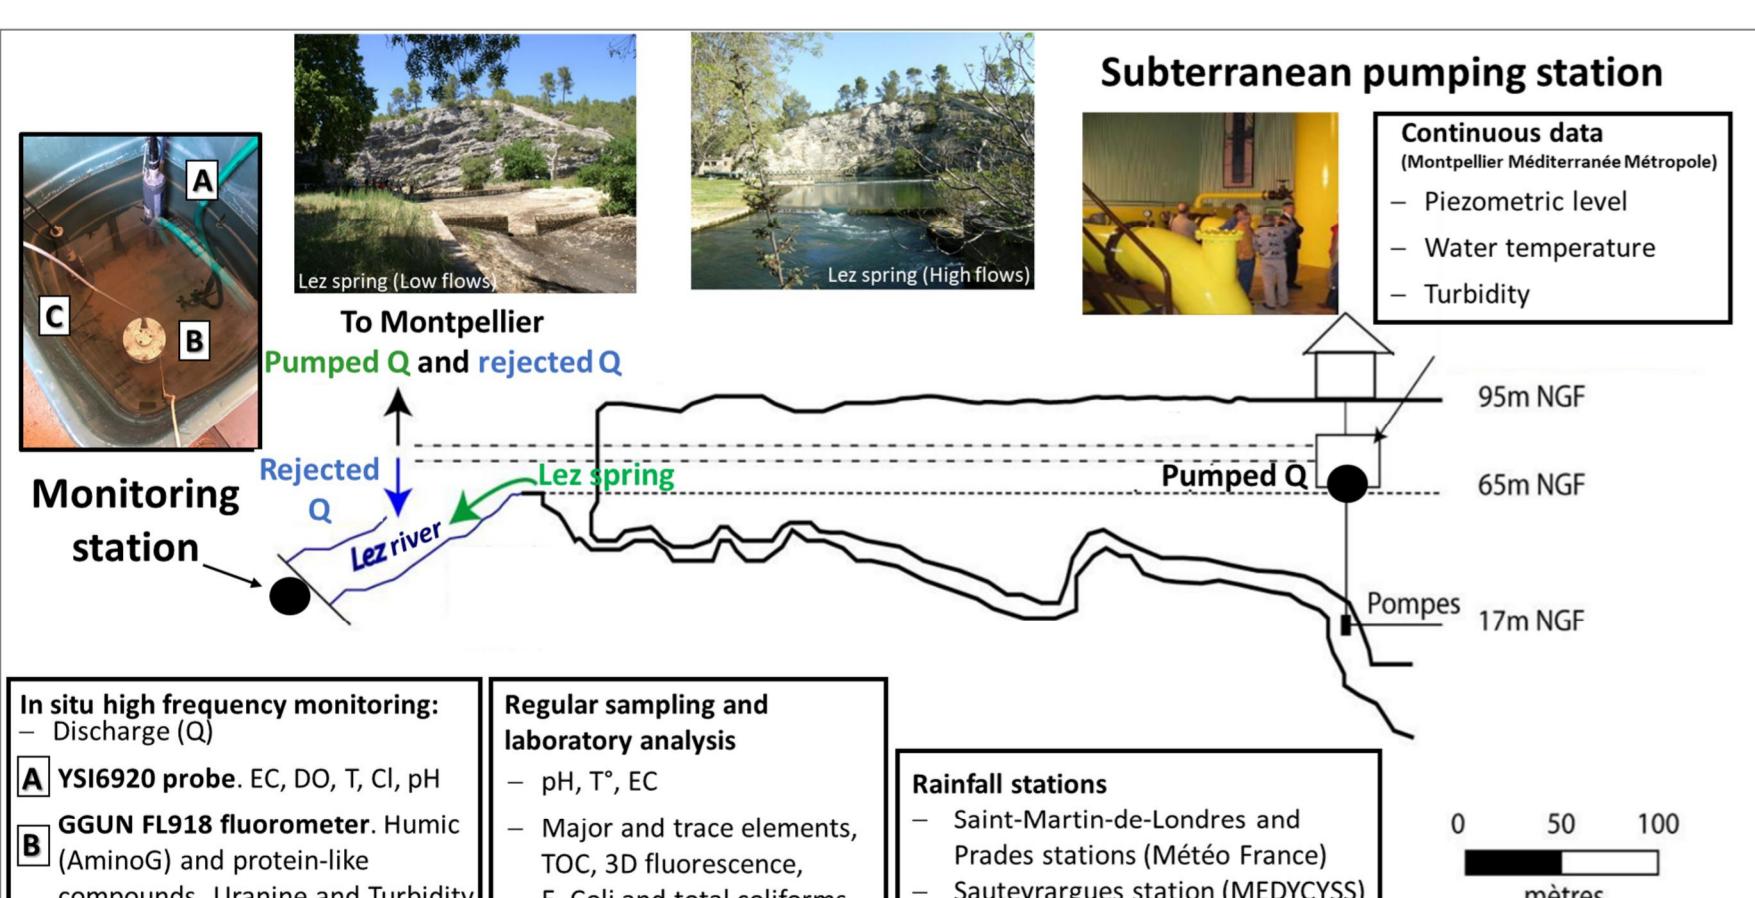

## Observation networks

- Regional scale:** boreholes, perennial and temporary springs, sink-holes
- Local scale:** Terrieu experimental site, located 5 km from the Lez spring, 22 boreholes of 60 m depth spread over an area of 0,5 km<sup>2</sup>
- Borehole scale:** continuous monitoring (P, T°, EC) on 15 boreholes, including the Triadou deep borehole (333m), located 700m upstream the Lez spring and near a temporary river (Triadou site). Equipped in 2014 with the "Multi-level monitoring PMPS, SolExperts » (Equipex CRITEX Project). It includes a series of packers isolating 5 producing zones for groundwater sampling and monitoring (P, T°).

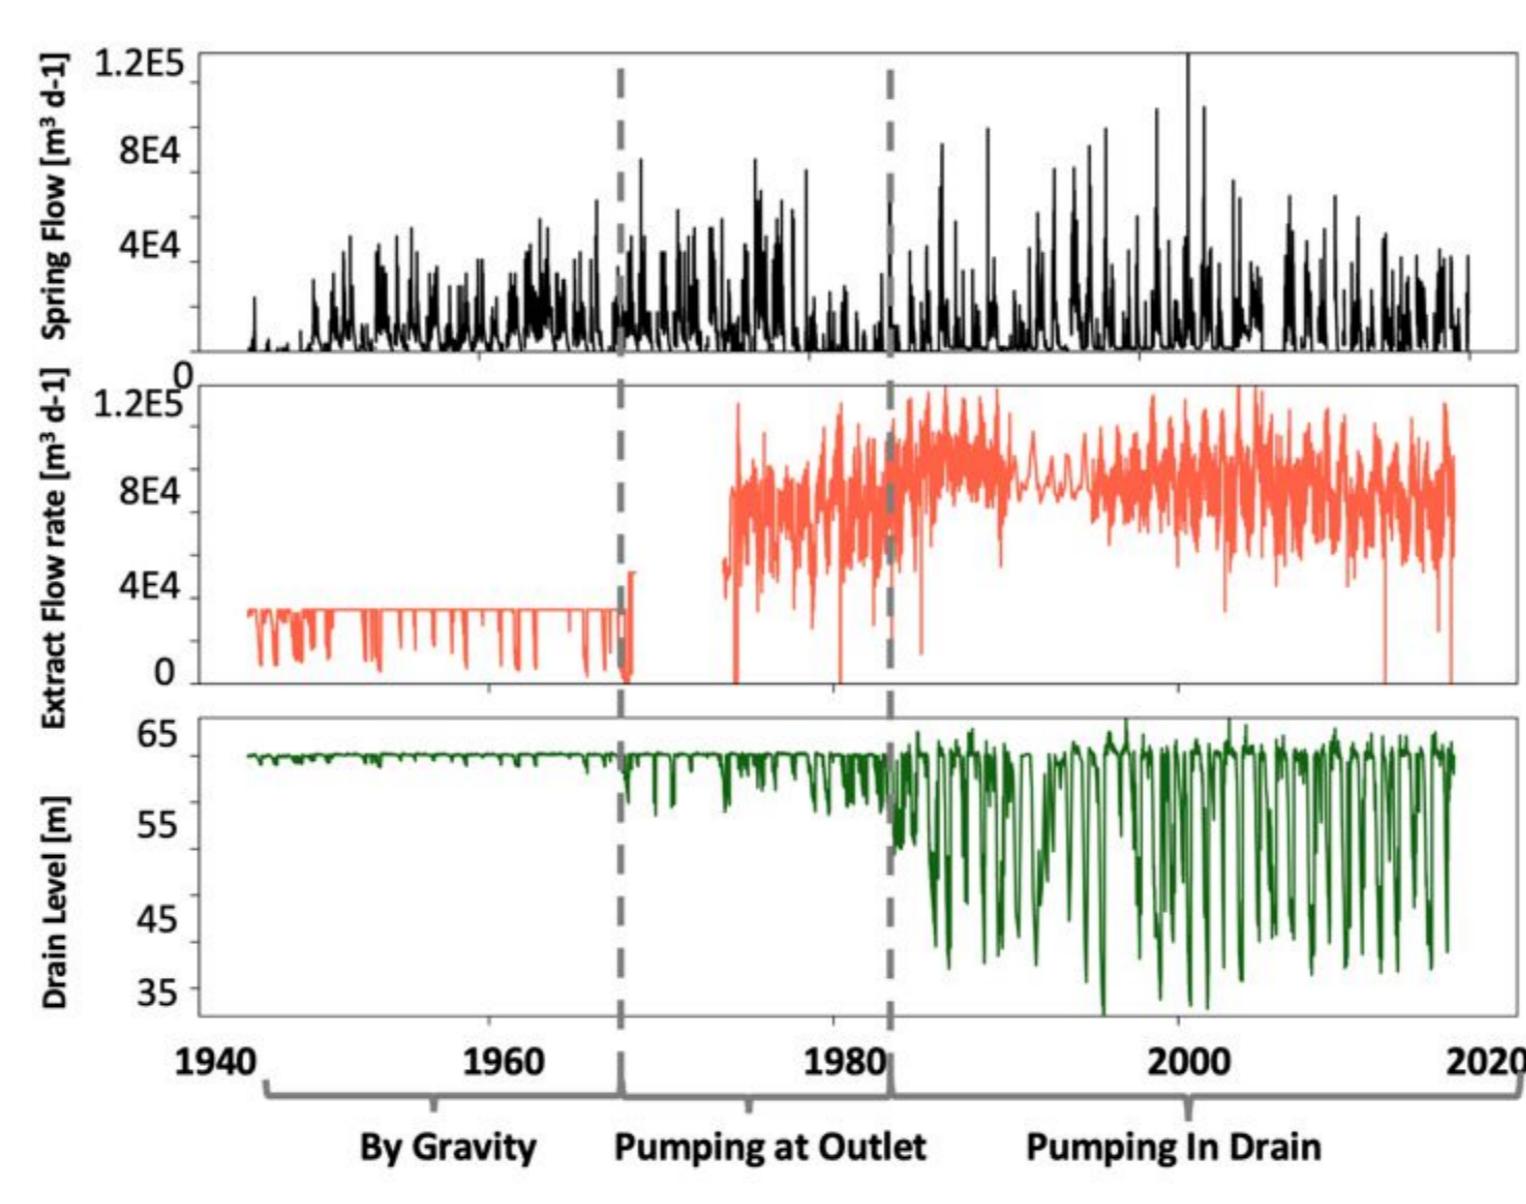

## Mediterranean karst water resources: water availability and quality

### Ongoing scientific challenges

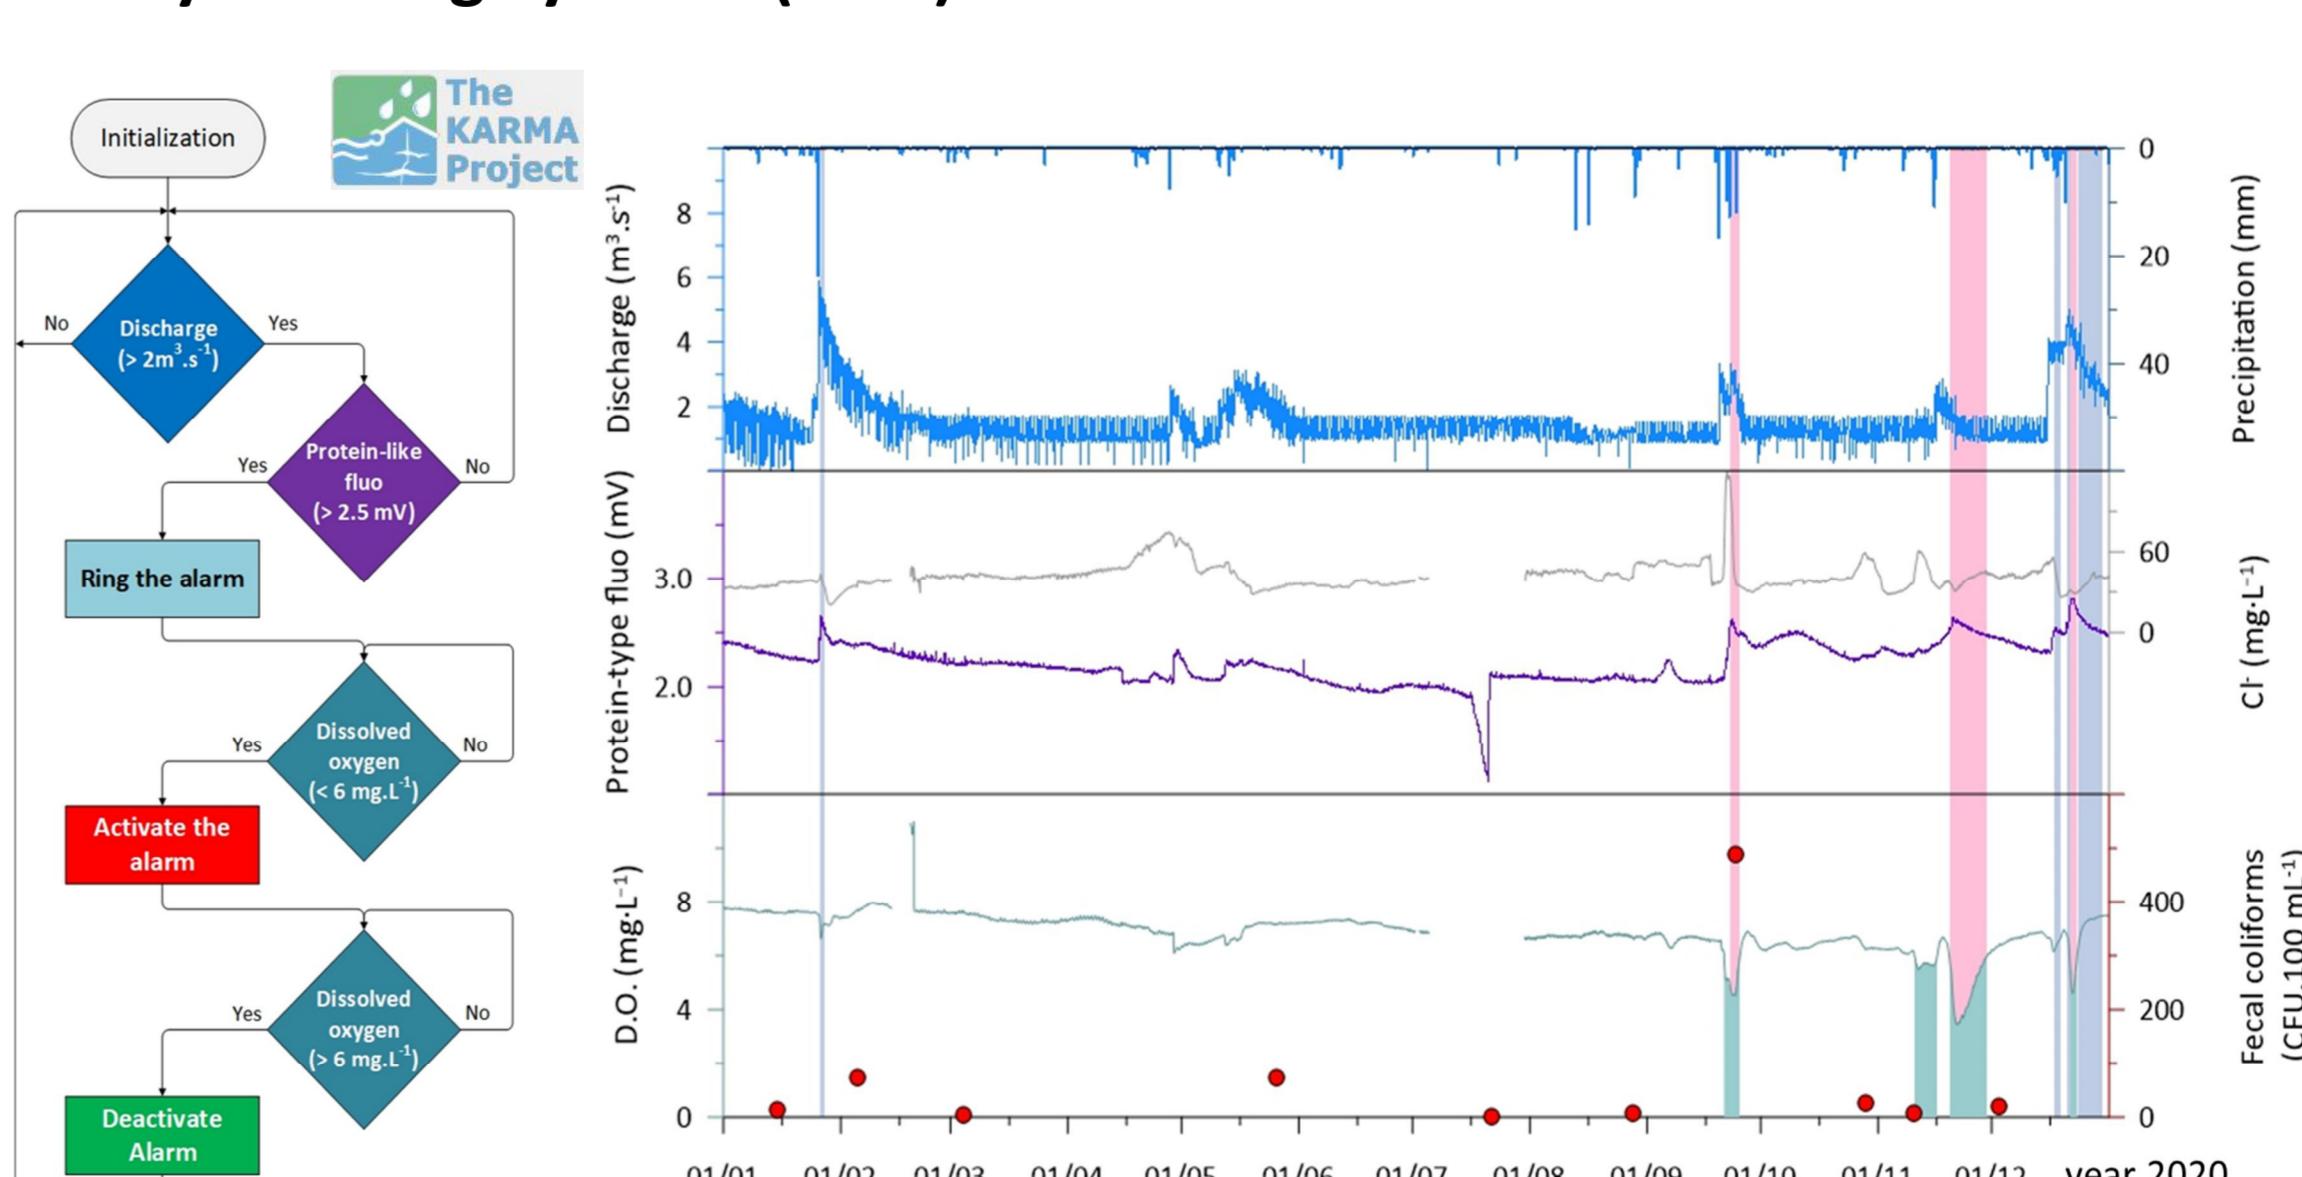

The Lez aquifer: a typical mediterranean karst system that supplies drinking water to 340 000 inhabitants of metropolitan Montpellier (Q<sub>mean</sub> pumping abstraction rate: 1080 l/s by active management)

Characterization of climate change and anthropogenic impacts on the recharge processes and water resources : Importance of long terms monitoring of karst systems

Development of specific hydrochemical tools to characterize the different origin of water, and water quality at karst outlets: contribution of in situ high frequency monitoring to develop Early Warning Systems (EWS)

High frequency monitoring of physico-chemical parameters coupled with regular sampling at the Lez spring. EWS development (KARMA Project) to provide useful informations to water suppliers and stakeholders in order to improve the management of freshwater resources [3]

Coupling numerical approaches and modeling: see Poster # 48 (Sivelle et al.)
